TSIS2 / Building a Customer Support Classifier

Create a customer support ticket classifier using Python and Streamlit.

Categories: delivery, return, product_question, spam.

Requirements:
1. User enters text message, clicks a button
2. System returns category and a reply template
3. Use DeepSeek API (free) for classification (base_url: https://api.deepseek.com/v1, model: deepseek-chat)
4. Log each request to logs.json (timestamp, input_text, category, template)
5. Add API error handling
6. Create requirements.txt
7. Create README.md with installation instructions

Write the complete code.

TSIS2 / Building a Customer Support Classifier

Add a copy button for the reply template. Use st.code with language="text" - it has built-in copy functionality.

Updating UI for Template Copying

I am adding a copy button to the reply template by switching from `st.info` to `st.code`.

Files Edited

Walkthrough app.py

Progress Updates Expand all

1 Modifying app.py to use st.code for templates

I have updated the Streamlit UI to use `st.code` for the reply template, which provides a built-in copy button for convenience.

app.py Open

Copy

I have a DeepSeek API key: sk-10da2ec9e34947fcbaa97b11b8b609c0

My app crashes with the error "api_key not found" because the code in classifier.py tries to read the key from the environment variable or .the env file.

DON'T SUGGEST THAT I CREATE FILES BY HAND.

Make sure that the key is taken from the input field in the sidebar in app.py . This field already exists, but it is not passed to classifier.py .

Fix it:

Ask anything, @ to mention, / for workflows

Thought for 4s

Refactoring API Key Management

I am refactoring the application to pass the DeepSeek API key directly from the UI to the classification logic, ensuring it works correctly without environment variables.

Files Edited

Implementation Plan Task

Progress Updates Expand all

1 Updating task list and implementation plan

I have updated the implementation plan to address the API key management issue. I will refactor the code to pass the key directly from the Streamlit sidebar to the classifier. Please review the changes.

Background Steps

Running background command Open

```
~/Downloads/TSIS2 $ streamlit run app.py

  You can now view your Streamlit app in your browser.

  Local URL: http://localhost:8502
  Network URL: http://192.168.0.102:8502

  For better performance, install the Watchdog module:

  $ xcode-select --install
  $ pip install watchdog
```

1 Notifying user and providing final report

I have refactored the application to pass the API key directly from the sidebar to the classification logic. The app is now running and ready for you to test with your key.

How to test:

1. Go to the running Streamlit app (e.g., http://localhost:8502).
2. Enter your key `sk-10da2ec9e34947fcbaa97b11b8b609c0` in the sidebar.
3. Classify a ticket.
